## Results

### Hypothesis 1: effect of legibility

When participants read illegible sentences, they were  $r = \text{ifelse}(\text{sign}(\text{beta1\_est}) == 1, \text{"more"}, \text{"less"})$  likely to change the sentence (b, se)

### Hypothesis 2: effect of similarity

### Hypothesis 3: interaction

### demographics

The mean age of the 14 participants is 37.0714286 the standard deviation is 13.1176. There are 6 females and 8 males.
